Magneto–Optical Ellipsometry on Ni$_2$MnIn and NiMnIn Heusler Alloys

GERD NEUBER, JAN SCHOLTYSSEK, MARTA BASTJAN, University of Hamburg, RALF RAUER, Chalmers University of Technology, ULRICH MERKT, MICHAEL RÜBHAUSEN, GUIDO MEIER, University of Hamburg — We use generalized magneto-optical ellipsometry [1,2] for measurements of the complete dielectric tensor of Ni$_2$MnIn [3] and NiMnIn Heusler alloys in the energy range from 1.6 eV to 5.5 eV and in the temperature range from 50 K to 450 K. Generalized magneto-optical ellipsometry allows the investigation of spin-polarized states and to understand the coupling between spin and charge degrees of freedom. We show differences in the metallic behavior of the semi-Heusler alloy NiMnIn and the full-Heusler alloy Ni$_2$MnIn related to the half-metallic ferromagnetism of the latter one.
