W₃O Nanowires as Gas Sensors

SHARVIL DESAI, University of Louisville, Department of Physics, BISWAPRIYA DEB, University of Louisville, Department of Chemical Engineering, GAMINI SUMANASEKERA¹, University of Louisville, Department of Physics, MAHENDRA SUNKARA, University of Louisville, Department of Chemical Engineering — N₂O interaction on thin films of W₃O nanowires and nanoparticles at different temperatures and concentrations was investigated. W₃O nanowire and nanoparticle films were synthesized on quartz substrates by Hot Filament Chemical Vapor Deposition. DC resistance measurements in the Van der Pauw geometrical methods were conducted on the films. It was observed that the W₃O nanowire thin film as a gas sensor resulted in an improved sensitivity as compared to the W₃O nanoparticle thin film. Impedance Spectroscopy measurements (1mHz - 100kHz) were also performed in both films to understand the underlying mechanism for these different responses. Measurements on single W₃O nanowire will also be presented.
