Nonlinear Analysis of Electromyography Time Series of Low Back Muscles

ULRICH ZURCHER, KAUFMAN MIRON, PAUL SUNG, Cleveland State University — We have calculated the mean-square displacement $\Delta(t)$ from the EMG time series and have found that increases diffusively, $\Delta(t) \sim t$, for short times $t < 10\text{ms}$, and shows a plateau-like behavior, $\Delta(t) \sim t^\alpha$, for intermediate times $10\text{ms} < t < 0.5\text{s}$. The plateau-like behavior implies the presence of correlations in the signal. We characterize these correlations and relate them to properties of the power spectrum of the signal.
