Negative spin polarization in Co|SrTiO₃|Co magnetic tunnel junctions¹ J. VELEV, K. BELASHCHENKO, University of Nebraska - Lincoln, D. STEWART, Cornell University, M. VAN SCHILFGAARDE, Arizona State University, S. JASWAL, E. TSYMBAL, University of Nebraska - Lincoln — We perform an *ab-initio* study of spin-polarized tunneling in epitaxial Co|SrTiO₃|Co magnetic tunnel junctions with bcc Co(001) electrodes. We predict a large tunneling magnetoresistance in these junctions, originating from a mismatch in the majority- and minority-spin bands both in bulk bcc Co and at the Co|SrTiO₃ interface. The intricate complex band structure of SrTiO₃ enables efficient tunneling of the minority *d*-electrons which causes the spin polarization of the Co|SrTiO₃ interface to be negative in agreement with experimental data². Our results indicate that epitaxial Co|SrTiO₃|Co MTJs with bcc Co(001) electrodes is a viable alternative for device applications. [1] J. VeleV et al., Phys. Rev. Lett. **95**, 216601(2005). [2] J.
