Reentrant Phase Diagram in Ortho-Para Mixtures of Solid H₂ at High Pressure

BALAZS HETENYI 1, SISSA, Trieste (Italy), SANDRO SCANDOLO, The Abdus Salam ICTP and INFM-CNR Democritos, Trieste (Italy), ERIO TOSATTI, SISSA, ICTP, and Democritos, Trieste (Italy) — Quantum effects dominate the low temperature phase diagram of solid molecular hydrogen in a wide range of pressures from ambient up to about 100 GPa. Important differences exist in the behavior of pure even-J(para-H₂ and ortho-D₂), and odd-J (ortho-H₂ and para-D₂) species, but little is known about the phase diagram of ortho-para mixtures. We develop a multiorder parameter mean-field formalism for systems of coupled quantum rotors and apply it to solid H₂ and D₂. For a thermal distribution of ortho-para molecules we find an anomalous reentrant orientational phase transition in the pressure - temperature phase diagram of both systems [Hetenyi et al., PRL 94, 125503 (2005)]. The correlation functions of the order parameter indicate short-range order at low temperatures. As the temperature is increased the correlation increases along the phase boundary. We also find that even extremely small odd-J concentrations (1%) can trigger short-range orientational ordering.
