Collective Excitations in a Molten Early transition Metal

AYMAN SAID, Argonne National Laboratory, USA, HARALD SINN, Argonne National Laboratory, USA, AHMET ALATAS, Argonne National Laboratory, USA, CLEMENT BURNS, Western Michigan University, DAVID PRICE, Oak Ridge National Laboratory, USA, MARRY SABOUNGI, CNRS, France, WALTER SCHIRMACHER, Technische Universität München, Germany — We report inelastic x-ray scattering measurements of the atomic collective excitations of an early transition metal, namely liquid titanium at T=2023K. The data show well defined sound excitations with a low damping constant comparable to the damping observed in liquid alkaline metals. The data agree very well with the predictions of mode-coupling theory.
