Stability of the B conformation in wet-spun films of CaDNA. M. SCHWENK\(\text{ER}, S.A. LEE, University of Toledo, A. RUPPRECHT, University of Stockholm — Highly oriented, wet-spun films of CaDNA have studied via Raman spectroscopy as a function of both water content and excess CaCl\(\text{2}\) concentration. The secondary structure of the double-helical DNA can be determined by monitoring the conformationally-sensitive vibrational modes at 807 cm\(^{-1}\) for A-DNA and 834 cm\(^{-1}\) for B-DNA. We find that the DNA molecules are in the B conformation between relative humidities of 98\% and 75\% for all salt contents.
