

Abstract for an Invited Paper  
for the MAR07 Meeting of  
The American Physical Society

**Nanofocusing of hard x-rays with profile coated elliptical mirrors<sup>1</sup>**

ALBERT MACRANDER, Argonne

The ability to focus hard x-rays by means of mirrors has progressed recently to the achievement of focus sizes well below 100 nm.[1] At the Advanced Photon Source at Argonne National Laboratory elliptical mirrors have been made by means of profile coating. [2] In this technology a highly precise elliptically shaped surface is achieved by magnetron sputtering of Au onto a flat silicon substrate. Results will be presented to detail the rapid progress being made in this technology. Also, results for wave optical simulations will be summarized. [3]. X-ray mirrors are achromatic focusing optics, and a nanofocused beam is expected to have many uses for experiments in condensed matter physics. [1] W. Liu, G. Ice, J. Tischler, A. Khounsary, C.
