**Reduced Density Matrix Descriptions for Electromagnetically Induced Transparency in Atomic Systems**<sup>1</sup> VERNE JACOBS, Naval Research Laboratory — Reduced density matrix descriptions are developed for electromagnetically induced transparency and related pump-probe optical phenomena in moving atomic systems, taking into account atomic collisions and external magnetic fields. Time-domain (equation-of-motion) and frequency-domain (resolvent-operator) formulations are developed in a unified manner. In a preliminary semiclassical perturbative treatment of the electromagnetic interaction, compact Liouville-space operator expressions are derived for the linear and the general (n'th order) non-linear electromagnetic-response tensors. These expressions are valid for coherent atomic excitations and for the full tetradic-matrix form of the collision operator in the Markov approximation.
