Nano-Particle Doped Hybrid Organic-Inorganic Photorefractives

GARY COOK, UTC, ANATOLIY GLUSHCHENKO, University of Colorado at Colorado Springs, VICTOR RESHETNYAK, University of Kyiv, RICHARD SUTHERLAND, SAIC, MOHAMMAD SALEH, UES, DEAN EVANS, WPAFB — We present results of beam coupling from hybrid photorefractive cells comprising a liquid crystal layer doped with nano-particles of ferroelectric materials adjacent to doped inorganic photorefractive windows. The presence of the nano-particles significantly enhances the optical coupling between the signal beam and pump beam. Full Bragg matched amplification of a signal beam is demonstrated for grating spacings from 5µm to less than 800nm.
