Magnetic field effects on the excitonic absorption spectra of semiconducting single-walled carbon nanotubes HONGBO ZHAO, University of Hong Kong, ZHENDONG WANG, SUMIT MAZUMDAR, University of Arizona — We have investigated the magnetic field effects on the electronic structure and absorption spectra of semiconducting single-walled carbon nanotubes (S-SWCNTs) within a Coulomb correlated π -electron model.^{1 2} We consider magnetic field parallel to the nanotube axis, which introduces the Aharonov-Bohm phase in the wavefunction. Recent experiments claim to have observed the energy shift and splitting due to the magnetic fields³ Some of our theoretical results are substantively different from existing results. Comparison with recent experiments are made.
