## Abstract Submitted for the MAR07 Meeting of The American Physical Society

Quantum projection noise limited spectroscopy with ions in a Penning-Malmberg trap. —Progress toward spin squeezed states.<sup>1</sup> NOBUYASU SHIGA, WAYNE ITANO, JOHN BOLLINGER, NIST, Boulder, CO 80305 — We describe plans and summarize initial progress towards making spin squeezed states with up to ~100 <sup>9</sup>Be<sup>+</sup> ions in a Penning-Malmberg trap. We use the ground-state electron spin-flip transition, which in the 4.5 T magnetic field of the trap has a transition frequency of 124 GHz, as the ion qubit. With a 30 mW Gunn diode oscillator we have observed Rabi flopping rates as high as ~7 kHz. We will summarize experimental progress on realizing projection noise limited spectroscopy on this transition, which is a prerequisite for demonstrating spin squeezing. For entangling the ions we plan to use a generalization of the few ion qubit phase gate developed at NIST <sup>2</sup> to generate an exp ( $i\chi J_z^2 t$ ) interaction between all of the ion qubits. This interaction can be implemented on a single plane of ions <sup>3</sup> with a motional sideband, stimulated Raman transition.
