**Critical Fidelity at the Metal-Insulator Transition** JOSHUA BODYFELT, Wesleyan University, GIM SENG NG, TSAMPIKOS KOTTOS, Wesleyan University, Max Planck Institute for Dynamics and Self-Organization — Using a Wigner Lorentzian Random Matrix ensemble, we study the fidelity,  $F(t)$ , of systems at the Anderson metal-insulator transition subject to small perturbations that preserve the criticality. We find that there are three decay regimes as perturbation strength increases: the first two are associated with a Gaussian and an exponential decay respectively and can be described using Linear Response Theory. For stronger perturbations,  $F(t)$  decays algebraically as  $F(t) \sim t^{-D_2^\mu}$ , where  $D_2^\mu$  is the correlation dimension of the Local Density of States.
