Superconducting properties of noncentrosymmetric $\text{Mg}_{10}\text{Ir}_{19}\text{B}_{16}$ ¹

TOMASZ KLIMCZUK, Faculty of Applied Physics, Gdansk University of Technology, Poland and Condensed Matter and Thermal Physics, Los Alamos National Laboratory, USA, ROBERT J. CAVA, Department of Chemistry, Princeton University, Princeton NJ 08544, USA, JOE D. THOMPSON, Condensed Matter and Thermal Physics, Los Alamos National Laboratory, USA — The magnetic, electrical transport and specific heat properties of the new ternary boride superconductor $\text{Mg}_{10}\text{Ir}_{19}\text{B}_{16}$ ($T_C = 5\text{K}$) have been investigated. The polycrystalline $\text{Mg}_{10}\text{Ir}_{19}\text{B}_{16}$ sample was synthesized by reaction of Mg and Ir metal powders with amorphous boron powder. The material has a noncentrosymmetric crystal structure (I-43m) and therefore the superconducting properties are a subject of great interest.

¹Work was performed under the auspices of the US Department of Energy, Office of Science
