Wet-chemistry synthesis and dielectric properties of pure and Rb and V doped Cs$_2$Nb$_4$O$_{11}$ JIANJUN LIU, Department of Physics, University of Nebraska at Omaha, ROBERT SMITH, Department of Chemistry, University of Nebraska at Omaha, WAI-NING MEI, Department of Physics, University of Nebraska at Omaha — Cs$_2$Nb$_4$O$_{11}$(CNO) is an antiferroelectric compound whose single crystal structure and antiferroelectric properties have been recently reported [1]. It has a space group of Pnna and a phase transition temperature at 165 °C. In this study we synthesized CNO powdered samples, both pure and doped with rubidium and vanadium, by using a wet-chemistry method. Dielectric measurements showed that the phase transition temperature shifted with the doping. We analyzed the mechanism of this antiferroelectric phase transition based on the observed results.
