In order to develop a detailed structural understanding of these junctions, we have made STM observations of the growth of pentacene on top of a monolayer film of C\textsubscript{60} on Ag(111). We observe pattern formation in the first pentacene layer due to the tensile stress arising from interactions with the underlying C\textsubscript{60}. The stress results in a striped pattern of alternating commensurate and incommensurate domains of pentacene with respect to the C\textsubscript{60} monolayer. The incommensurate domains appear as bright regions $3.6 \pm 0.6$ nm in width and are discussed using a 1D Frenkel-Kontorova model. *Supported by the NIST Center of Nanomanufacturing and Metrology and the University of Maryland MRSEC via DMR-05-20471.[1] Yoo et al., Appl. Phys. Lett. 85, 5472 (2004).
