Do ‘magic’ Electronegativities exist for superconductivity?\textsuperscript{1}

O. PAUL ISIKAKU-IRONKWE, The Center for Superconductivity Technologies[TCST], Abuja FCT, Nigeria — Studies have established a strong correlation between electronegativity and superconductivity. Here we examine the electronegativity values of many known binary superconducting systems[A-15s, Y\textsubscript{2}C\textsubscript{3}, CaSi\textsubscript{2}, MgB\textsubscript{2},...] with high transition temperatures and use those[magic] values and their series to predict new superconducting materials. We also estimate the transition temperatures of the predicted compounds if they could be formed under pressure.
