Pauli-Limited Superconductors with Magnetic Fluctuations

ROBERT BEAIRD, Louisiana State University, ANTON VORONTSOV, University of Wisconsin- Madison, ILYA VEKHTER, Louisiana State University — We examine the temperature (T) and magnetic field (B) phase diagram of a paramagnetically-limited superconductor in the presence of fluctuating magnetic moments. We derive a Ginzburg- Landau free energy functional for the superconducting order from microscopics and include classical fluctuations of the magnetization. We consider the full wave vector (q) dependence of the expansion coefficients and examine the onset of both the uniform and spatially modulated superconducting phases along critical magnetic field $B_c(T)$. In the absence of fluctuations, both superconducting transitions are second order in 2D and meet at a tricritical point $B_c(T^*)$. We find that including magnetic fluctuations introduces first order transitions into the superconducting phase. We find the tricritical points where these transitions meet and determine $B_c(T)$ and $q(T)$ as functions of the coupling between superconducting order and the fluctuating magnetization.
