An Exact Condition for the Integrand of Adiabatic Connection¹

ZHENFEI LIU, KIERON BURKE, University of California, Irvine — In density functional theory (DFT), the exchange-correlation functional E_{XC} can be exactly expressed by the adiabatic connection integral [1,2]. The integrand should satisfy several exact conditions [3]. We show that for the low-density limit (as $\lambda \rightarrow \infty$), the λ^{-1} term in the expansion of the integrand $W(\lambda)$, should vanish. We propose a simple parametric form for $W(\lambda)$, satisfying the new exact condition. We apply this interpolation form to Hooke's atom and helium atom and show that it is accurate for weakly-correlated two-electron systems.
