A magnetic field-induced crossover to a non-universal regime in a Kondo dot

ANDREI KOGAN, TAI-MIN LIU, BRYAN HEMINGWAY, University of Cincinnati, STEVEN HERBERT, Xavier University, MICHAEL MELLOCH, Purdue University, UNIVERSITY OF CINCINNATI TEAM, XAVIER UNIVERSITY COLLABORATION, PURDUE UNIVERSITY COLLABORATION — We have measured the magnetic splitting, \( \Delta_K \), of a Kondo peak in the differential conductance of a Single-Electron Transistor while tuning the Kondo temperature, \( T_K \), along two different paths in the parameter space: varying the dot-lead coupling at a constant dot energy, and vice versa. At a high magnetic field, \( B \), the changes of \( \Delta_K \) with \( T_K \) along the two paths have opposite signs, suggesting that \( \Delta_K \) is not a universal function of \( T_K \). At low \( B \), we observe a decrease in \( \Delta_K \) with \( T_K \) along both paths. Detailed \( \Delta_K(B) \) data for two different \( T_K \) show consistency for the splitting onset. Furthermore, we find \( \Delta_K/\Delta < 1 \) at low \( B \) and \( \Delta_K/\Delta > 1 \) at high \( B \), where \( \Delta \) is the Zeeman energy of the bare spin. We discuss an approximate scaling of \( \Delta_K \) with \( B/T_K \) at low \( B \) and compare the findings to previous measurements and theory.
