Gravitational Redshift and Deflection of Slow Light

JUSTIN DRESSEL, S. RAJEEV, JOHN HOWELL, ANDREW JORDAN, University of Rochester — We explore the nature of the classical propagation of light through media with strong frequency-dependent dispersion in the presence of a gravitational field. In the weak field limit, gravity causes a redshift of the optical frequency, which the slow-light medium converts into a spatially-varying index of refraction. This results in the bending of a light ray in the medium. We further propose experimental techniques to amplify and detect the phenomenon using weak value measurements. Independent heuristic and rigorous derivations of this effect are given.
