Size effect and sp^3 bond formation in carbon nanotube bending¹

CHUN TANG, Department of Physics & High Pressure Science and Engineering Center, University of Nevada, Las Vegas, WANLIN GUO, Institute of Nano Science, Nanjing Univ. Aero & Astro., CHANGFENG CHEN, Department of Physics and High Pressure Science and Engineering Center, University of Nevada Las Vegas — We report molecular dynamics simulations of bending behaviors of carbon nanotubes (CNTs). Due to the interlayer interaction, single-walled CNTs (SWCNTs) and multi-walled CNT (MWCNTs) show different buckling characters both in deformation pattern and energetic evolution. Simulations in post-buckling region show that large bending strain leads to sp^3 bond formation in kink areas and that the capability of sp^3 bond formation is sensitive to tube size. These results suggest a new route for structure engineering of CNTs.
