Topological Quantum Phase Transition in One-dimensional Spin Chain

HONG-CHEN JIANG, JIA-DONG ZANG, ZHENG-YU WENG, SHOU-CHENG ZHANG — We construct a Hamiltonian between AKLT and SZH model for one-dimensional $S = 2$ spin chain, where a variable parameter $\alpha$ is introduced. The edge spin is boson-like for AKLT model ($\alpha = 0$), while fermion-like for SZH model ($\alpha = 1$). Due to this distinction, topological quantum phase transition is predicted, and is addressed by large-scale DMRG calculation.
