Non-Fermi-Liquid Behavior in Gold Nanowires on Ge(001)

RENE MATZDORF, University of Kassel, CHRISTIAN BLUMENSTEIN, JOERG SCHAEFER, SEBASTIAN MEYER, University of Wuerzburg, SEBASTIAN MIETKE, MELANIE KLINKE, TATJANA PODLICH, University of Kassel, RALPH CLAESSEN, University of Wuerzburg — In the recently discovered self-organized Au atomic nanowires on Ge(001) a power-law behavior in the density of states (DOS) has been discovered by low-temperature scanning tunneling spectroscopy (STS). We present temperature dependent STS data in a temperature range from $T = 5\text{K}$ to $T = 50\text{K}$ that show energy and temperature dependence as expected for Luttinger-liquids. The structure of the system has been studied by low-temperature scanning tunneling microscopy (STM) and low-energy electron diffraction (LEED). A subtle four-fold periodicity along the chains is found, lacking lateral phase correlation. An energy gap relating to a charge density wave is not observed.
