CANFIELD, Ames Laboratory, Iowa State University, T. GOKO, McMaster University, Columbia University, TRIUMF, G.M. LUKE, McMaster University — Single crystals of Ba(Fe$_{1-x}$Co$_x$)$_2$As$_2$ and Sr(Fe$_{1-x}$Co$_x$)$_2$As$_2$ were studied using Transverse field (TF)-µSR. We measured the penetration depth in the superconducting state by fitting the µSR spectra to a microscopic model for a range of applied magnetic fields and dopings. We have fit the temperature dependence of the superfluid density to a phenomenological two-gap model. We find that the low-temperature superfluid density varies roughly linearly with superconducting $T_C$, both of which decrease with increasing Co substitution above $x = 0.06$.
