A doping dependent study of nonequilibrium quasiparticle dynamics in electron and hole doped BaFe$_2$As$_2$

DARIUS TORCHINSKY, JAMES MCIVER, DAVID HSIEH, MIT, G.F. CHEN, J.L. LUO, N.L. WANG, Beijing National Laboratory for Condensed Matter Physics, Institute of Physics, Chinese Academy of Sciences, NUH GEDIK, MIT — We report on measurements of the doping dependence of quasiparticle dynamics in single-crystals of Ba$_{1-x}$K$_x$Fe$_2$As$_2$ and Ba(Fe$_{1-x}$Co$_x$)$_2$As$_2$ in the superconducting state via ultrafast pump-probe spectroscopy. Quasiparticles are injected into the samples by ultrashort laser pulses. Once injected, they cause a reflectivity change of the sample at the laser frequency, allowing time-resolved optical measurements of their density. Our measurements reveal band-dependent quasiparticle recombination which provide clues on gap symmetry and electron-boson coupling.
