

Abstract Submitted  
for the MAR11 Meeting of  
The American Physical Society

**A course in Computational Physics** GEORGE RAWITSCHER, University of Connecticut — This course, taught at UConn, has several objectives: 1) To make the students comfortable in using MATLAB; 2) To reveal the existence of unavoidable inaccuracies due to numerical roundoff errors and algorithm inaccuracies; 3) to introduce modern spectral expansion methods [1], and compare them with conventional finite difference methods. Some of the projects assigned in the course will be described, such as the motion of a falling parachute, and the vibrations of an inhomogeneous vibrating string [2].
