Exact Chiral Spin Liquid with Stable Spin Fermi Surface on the Kagome Lattice

VICTOR CHUA, Department of Physics, University of Texas at Austin, HONG YAO, Department of Physics, University of California, Berkeley, California, GREGORY FIETE, Department of Physics, University of Texas at Austin — We study an exactly solvable quantum spin model of Kitaev type on the kagome lattice. We find a rich phase diagram which includes a topological (gapped) chiral spin liquid with gapless chiral edge states, and a gapless chiral spin liquid phase with a spin Fermi surface. The ground state of the current model contains an odd number of electrons per unit cell which qualitatively distinguishes it from previously studied exactly solvable models with a spin Fermi surface. Moreover, we show that the spin Fermi surface is stable against weak perturbations.
