Spin susceptibility of spin-1/2 fermions with dipole interactions¹

BENJAMIN M. FREGOSO, University of Chicago, EDUARDO FRADKIN, University of Illinois at Urbana-Champaign — The general form of the spin susceptibility is found for spin- 1/2 fermions with dipole interactions. In the paramagnetic phase and partially magnetized phase (ferro-nematic) the spin susceptibility is explicitly computed in the Random Phase Approximation. Important modifications to the static susceptibility are discussed which are relevant for future experiments. Unconventional collective modes in the paramagnetic and ferro-nematic phases are also discussed.
