Large and Small Signal Analyses of Spin Modulation in Lasers

CHRISTIAN GOTHGEN, JEONGSU LEE, RAFAL OSZWALDOWSKI, IGOR ZUTIC, SUNY at Buffalo — We have developed a set of rate equations for semiconductor spin-lasers that contain spin-polarized carriers (electrons and holes) in the active region due to spin-polarized (electrical or optical) injection. Previous studies consider the steady-state regime [1-5], showing advantages of the spin-lasers over its conventional counterparts such as threshold reduction and enhanced emission intensity [6]. We suggest a further improvement of spin lasers under dynamical operation. We use both large and small signal analyses to show that the spin-polarized injection can lead to an enhanced bandwidth and desirable switching properties of spin-lasers. Supported by ONR, AFOSR, NSF-ECCS CAREER.
