Synthesis and basic characterization of the itinerant ferromagnet Cr$_{11}$Ge$_{19}$

NIRMAL GHIMIRE, University of Tennessee, MICHAEL MCGUIRE, Oak Ridge National Laboratory, DAVID MANDRUS, University of Tennessee and Oak Ridge National Laboratory — Cr$_{11}$Ge$_{19}$ is a member of the tetragonal, but structurally complex family of materials known as Nowotny chimney-ladder phases. These materials have composition T$_n$X$_m$ where 2 > $m/n > 1.25$ (T=transition element, X=Si, Ge, Sn or Ga). Although Cr$_{11}$Ge$_{19}$ was reported to be an itinerant ferromagnet, its basic properties have not been well characterized. Here we present resistivity, magnetization, and heat capacity results on polycrystalline Cr$_{11}$Ge$_{19}$.
