Dichotomy between Large Local and Small Ordered Magnetic Moments in Iron-Based Superconductors

PHILIPP HANSMANN, Vienna University of Technology, RYOTARO ARITA, Department of Applied Physics, University of Tokyo, ALESSANDRO TOSCHI, SHIRO SAKAI, GIORGIO SAN-GIOVANNI, KARSTEN HELD, Institut for Solid State Physics, Vienna University of Technology — We study a four-band model for iron-based superconductors within the local density approximation combined with dynamical mean-field theory (LDA+DMFT). This successfully reproduces the results of models which take As p degrees of freedom explicitly into account and has several physical advantages over the standard five d-band model. Our findings reveal that the new superconductors are more strongly correlated than their single-particle properties suggest. Two-particle correlation functions unveil the dichotomy between local and ordered magnetic moments in these systems, calling for further experiments to better resolve the short time scale spin dynamics.
