Neutron and ARPES constraints on the couplings of the multi-orbital Hubbard model for the iron pnictides\textsuperscript{1} QINLONG LUO, ADRIANA MOREO, ELBIO DAGOTTO, Univ. of Tennessee/ORNL, GEORGE MARTINS, Oakland Univ., DAO-XIN YAO, Sun Yat-Sen Univ., MARIA DAGHOFER, IFW Dresden, RONG YU, Rice Univ. — The results of neutron-scattering and angle-resolved photoemission experiments for the Fe-pnictide parent compounds are shown to impose severe constraints on the range of values that can be considered “realistic” for the intraorbital Hubbard repulsion $U$ and Hund coupling $J$ in multiorbital Hubbard models treated in the mean-field approximation. Phase diagrams for undoped three- and five-orbital models are discussed, and the physically realistic regime of couplings is highlighted \textsuperscript{[1]}.
