**Nematicity in 3-band Hubbard model of cuprate superconductors**

KYUNGMIN LEE, JUNPING SHAO, Cornell University, RICHARD SCALET-TAR, University of California - Davis, MICHAEL LAWLER, SUNY Binghamton, EUN-AH KIM, Cornell University — The recent discovery of intra-unit-cell nematicity in STM studies of cuprate superconductors [1] underscores the importance of the role played by oxygen orbitals in CuO<sub>2</sub> plane. Motivated by this observation we study 3-band Hubbard model using exact diagonalization. In particular, we investigate the effects various interaction parameters ( $U_d$ ,  $U_p$ ,  $V_{pd}$ ,  $V_{pp}$ ) have on nematicity. Interestingly, we find that  $U_d$ , the on-site repulsion at copper sites, enhances nematicity in the strongly coupled regime.
