Microscopic model for the Sr$_{n+1}$Ir$_n$O$_{3n+1}$ Ruddlesden-Popper series of materials

JEAN-MICHEL CARTER, HAE-YOUNG KEE, University of Toronto — The Sr$_{n+1}$Ir$_n$O$_{3n+1}$ family of materials displays an insulator to metal transition as the number of layers (n) increases. The presence of large spin-orbit coupling is believed to be a significant ingredient for the novel $J_{\text{eff}} = 1/2$ state found in Sr$_2$IrO$_4$. We offer a microscopic tight-binding Hamiltonian with spin-orbit coupling and Hubbard interactions, and compare our results with experimentally observed phases.
