Spin injection studies on thin film Fe/MgO/Si tunneling devices

JONAS BEARDSLEY, YONG PU, Ohio State University, ADRIAN SWARTZ, University of California Riverside, VIDYA BHALLAMUDI, Ohio State University, ROLAND KAWAKAMI, University of California Riverside, EZEKIEL JOHNSTON-HALPERIN, CHRIS HAMMEL, JON PELZ, Ohio State University — We report progress on the injection of spin polarized electrons into 35 nm thick Si films, using Fe/MgO injector/tunnel barrier structures grown by molecular beam epitaxy on SIMOX silicon-on-insulator substrates. The device requires heavy top-surface n-type doping of the Si film to produce a suitable tunnel barrier, accomplished by diffusion from a spin-on phosphorous-doped glass. Measurements indicate a roughly exponential doping profile with $7E20$ per cubic cm at the top surface and a 2 nm decay length. Three terminal measurements showed evidence of spin injection similar to reports of Jansen et al. [1], while injection with a thinner MgO barrier shows more complicated behavior. On-going measurements and modeling will be discussed.
