High-Pressure Structural Studies of AuX_2 ($\text{X} = \text{Al}, \text{Ga}, \text{In}$)¹

JASON BAKER, RAVHI KUMAR, ANDREW CORNELIUS, HiPSEC and Dep. Physics, University of Nevada, Las Vegas — High-pressure x-ray diffraction experiments were performed on the group of intermetallic compounds, AuX_2 ($\text{X} = \text{Al}, \text{Ga},$ and In), which at ambient conditions crystallize in the CaF_2 [Space group $\text{Fm}\bar{3}\text{m}$] structure. The previously reported retention of the CaF_2 phase until 24 GPa in AuIn_2 was not observed in these experiments, and instead was observed to undergo a pressure-induced phase transition at 13 GPa. Both AuAl_2 and AuGa_2 undergo pressure-induced phase transitions at 15 GPa and 9 GPa, respectively. The structural details and the phase transition sequence in these compounds will be presented.

¹Work at UNLV is supported by DOE [DE-FC52-06NA27684] and NNSA.
