Non-Abelian Braiding of Lattice Bosons

ELIOT KAPIT, PAUL GINSPARG, ERICH MUELLER, Cornell University — We report on a numerical experiment in which we use time-dependent potentials to braid non-abelian quasi-particles. We consider lattice bosons in a uniform magnetic field within the fractional quantum Hall regime, where $\nu$, the ratio of particles to flux quanta, is near $1/2$, $1$ or $3/2$. We introduce time-dependent potentials which move quasiparticle excitations around one another, explicitly simulating a braiding operation which could implement part of a gate in a quantum computation. We find that different braids do not commute for $\nu$ near $1$ and $3/2$, with Berry matrices respectively consistent with Ising and Fibonacci anyons. Near $\nu = 1/2$, the braids commute.
