Tecnologias de la Informacion, Inst. de Ciencia de Materiales, Madrid (Spain), C.D. BATISTA, Los Alamos National Laboratory, Los Alamos, NM — $\text{Lu}_2\text{MnCoO}_6$ is a new member of the multiferroics with coupling between net magnetization and net electric polarization. Similar to $\text{Ca}_3\text{MnCoO}_6$, an up-up-down-down order of the magnetic spins is found that breaks spatial-inversion symmetry and creates an electric polarization. Unlike $\text{Ca}_3\text{MnCoO}_6$, the Co and Mn ions are both in a $S = 3/2$ state, the ordering temperature is 42 K, and the magnetic field needed to suppress electric polarization is 2 T. We present an experimental study of the multiferroic properties and spin structure including neutron diffraction, electric polarization, magnetization, dielectric constant, and specific heat measurements.
