EIT-like effect due to hetero-phase oscillations near the phase transition of relaxor ferroelectrics JEAN TOULOUSE, RADHA K. PATTNAIK\(^1\), Lehigh University, LYNN A. BOATNER, Oak Ridge National Laboratory — We report the observation of a remarkable “transparency window” in the dielectric resonant absorption spectrum of the relaxor ferroelectric K\(_{1-x}\)Li\(_x\)TaO\(_3\) (KLT) in the vicinity of its weakly first order transition. This phenomenon is shown to be conceptually similar to the electro-magnetically induced transparency (EIT) phenomenon observed in certain atomic vapors. In KLT however, it reveals the presence of hetero-phase (cubic-tetragonal) fluctuations and provides unique information on the nature and mechanism of the phase transition in relaxors.
