Quantum filtering one bit at a time\textsuperscript{1} JASON RALPH\textsuperscript{2}, NEIL OXTOBY, University of Liverpool, UK — We consider the purification of a quantum state using the information obtained from a continuous measurement record, where the classical measurement record is digitized to a single bit per measurement after the measurements have been made. Analysis indicates that efficient and reliable state purification is achievable for one- and two-qubit systems. We also consider quantum feedback control based on the discrete one-bit measurement sequences.
