Imaging broken symmetry in the electronic structure of Bi-doped cuprates by scanning tunneling microscopy

YANG HE, TESS WILLIAMS, ANJAN SOUMYANARAYANAN, MICHAEL YEE, Harvard University, TAKESHI KONDO, HIROSHI IKUTA, Nagoya University, ERIC HUDSON, Pennsylvania State University, JENNIFER HOFFMAN, Harvard University — The relationship between the mysterious pseudogap phase in the cuprate superconductors and the myriad broken symmetries observed by various experimental techniques is a source of much controversy. We use low-temperature scanning tunneling microscopy and spectroscopy to image electronic nematic order in the cuprate superconductor Bi$_{2-x}$Pb$_{x}$Sr$_{2}$CuO$_{6+\delta}$. We determine the robustness of the nematic order parameter to experimental conditions.

We acknowledge funding from NSF(DMR-0847433), NDSEG, A’STAR, and NSERC.
