**Magnetic field enhanced structural instability in  $\text{EuTiO}_3$**

ZURAB GUGUCHIA, HUGO KELLER, Physik-Institut der Universität Zürich, JÜRGEN KÖHLER, ANNETTE BUSSMANN-HOLDER, Max-Planck-Institut für Festkörperforschung —  $\text{EuTiO}_3$  undergoes a structural phase transition from cubic to tetragonal at  $T_S = 282$  K which is not accompanied by any long range magnetic order. However, it is related to the oxygen octahedra rotation driven by a zone boundary acoustic mode softening. Here we show that this displacive second order structural phase transition can be shifted to higher temperatures by the application of an external magnetic field ( $\Delta T_S \simeq 4$  K for  $\mu_0 H = 9$  T). This observed field dependence is in agreement with theoretical predictions based on a coupled spin-anharmonic-phonon interaction model.
