The American Physical Society

Man-Made “Global Warming/Climate Change”: A Critical Analysis of some of the Scientific and Methodological Approaches LAURENCE I. GOULD, University of Hartford — Many arguments have been made that – as a result of human activities which emit greenhouse gases (mainly carbon dioxide) – there is a trend of increasing global temperatures so as to result in such physical events as melting glaciers, rising sea levels, and increased storms. This presentation will examine some of the arguments given for such a trend in the light of corresponding counter-arguments [1].
