Morphology of candidate high dielectric constant polymers\textsuperscript{1}

DANIEL W. SINKOVITS, MANISH AGARWAL, MAYANK MISRA, SANAT KUMAR, Columbia University — We perform all-atom molecular dynamics simulations of polymers which have been identified as promising candidates for high dielectric constant capacitor applications by single-chain density functional theory calculations. These include both organic polymers and those with SnF\textsubscript{2} substitutions. We determine the large-scale morphology of these polymers using both \textit{NPT} molecular dynamics simulations and a multistep thermodynamic integration technique.
