Abstract for an Invited Paper  
for the MAR13 Meeting of  
the American Physical Society

**Mechanical resonators based on nanotubes and graphene**

ADRIAN BACHTOLD, ICFO, Barcelona, Spain

Carbon nanotubes and graphene offer unique scientific and technological opportunities as nanoelectromechanical systems (NEMS). Namely, they have allowed the fabrication of mechanical resonators that can be operable at ultra-high frequencies and that can be employed as ultra-sensitive sensors of mass and charge. In addition, nanotubes and graphene have exceptional electron transport properties, including ballistic conduction over long distances. Coupling the mechanical motion to electron transport in these remarkable materials is thus highly appealing. Here, I will review some of our recent results on nanotube and graphene NEMs, including the control of the mechanical oscillation using Coulomb blockade and mass sensing at the proton mass level.
