Cell Studies of BiFeO₃ nanoparticles for multimodal imaging

SUVRA LAHA, MAHESHIKA PALIHAWADANA ARACHCHIGE, AMANDA FLACK, SAGAR PAUDEL, JAIPAL SINGH, AMULYA RAJAGOPAL, SANJANA KULKARNI, MICHAEL SYNDER, JOE RAKOWSKI, XUEQUN CHEN, BHANU JENA, GAVIN LAWES, Wayne State University — There is considerable interest in using nanoparticles as contrast agents to improve diagnostic imaging. BiFeO₃ nanoparticles may be particularly interesting as multimodal contrast agents for both magnetic resonance imaging and x-ray imaging because these combine a large magnetic susceptibility with high atomic mass constituents. We synthesized BiFeO₃ nanoparticles using a chemical co-precipitation technique. We measured the structural and morphological characteristics of these nanoparticles using x-ray diffraction, electron microscopy, dynamic light scattering, and zeta potential, and probed the magnetic properties through both ac and dc magnetization studies. In order to investigate the cytotoxicity and intracellular distribution of these BiFeO₃ nanoparticles, we cultured them with mouse insulinoma MIN 6 cells and used optical microscopy to investigate the distribution and cell growth. We discuss the cytotoxicity of these nanoparticles, which will be crucial factor for determining possible biomedical applications together with a discussion of the cellular distribution of these nanoparticles.
