Magnetic Relaxation Mechanisms in Lanthanide Single Molecule Magnets

Liviu Chibotaru, Liviu Ungur, Theory of Nanomaterials Group, KU Leuven, Eric McInnes, Richard Winpenny, School of Chemistry and Photon Science Institute, University of Manchester, THEOREY OF NANOMATERIALS GROUP TEAM, SCHOOL OF CHEMISTRY AND PHOTON SCIENCE INSTITUTE TEAM — Ab initio investigation of multiplet spectrum of lanthanides in archetypal coordination geometries shows an unexpected regular structure consisting of (i) mirror symmetry of anisotropic magnetic properties of doublet states, (ii) high magnetic axially of low-lying and high-lying doublets, comparable to complexes with ideal axial symmetry, and (iii) the strong rotation of the anisotropy axes of individual doublets [1]. The obtained high axially of the ground doublet states explains the SMM behaviour of low-symmetry lanthanide complexes. Ab initio calculations predict that depending on the relative orientation of anisotropy axes in different doublet states, the relaxation can proceed via the first or the second excited state. Here we report new lanthanide cage complexes where two competing relaxation pathways through the first and second excited states are observed, leading to very high energy barriers for loss of magnetisation [2].
