Experimental demonstration of superconducting critical temperature increase in electromagnetic metamaterials\textsuperscript{1} VERA SMOLYANINOVA, BRADLEY YOST, KATHRYN ZANDER, THOMAS GRESOCK, Towson University, MICHAEL OSOFSKY, HEUNGSOO KIM, NRL, SHANTA SAHA, RICHARD GREENE, IGOR SMOLYANINOV, University of Maryland — A recent proposal that the metamaterial approach to dielectric response engineering may increase the critical temperature of a composite superconductor-dielectric metamaterial has been tested in experiments with compressed mixtures of tin and barium titanate nanoparticles of varying composition. An increase of the critical temperature of the order of 0.15 K compared to bulk tin has been observed for 40\% volume fraction of barium titanate nanoparticles. Similar results were also obtained with compressed mixtures of tin and strontium titanate nanoparticles.
