A Local Representation Of The Dielectric Response Function¹

DEYU LU, XIAOCHUAN GE, Brookhaven National Laboratory — The screened dielectric response function (χ) is a fundamental physical quantity that captures the many-electron correlation effects, key to the accurate description of van der Waals dispersion interaction in the ground state and a range of excited state properties. Although χ is non-local by definition, a real space partition of χ onto local structural motifs can help us gain further physical insight into, e.g., effective local screening properties. Because the construction of bare response function, χ_0 , is associated with the product of electron - hole orbitals, standard localization procedures for electron wave functions can not be directly applied. In this work, we propose a new method to decompose χ_0 into contributions from local response functions. Exemplary results of finite and bulk systems are discussed.

¹Research carried out at the Center for Functional Nanomaterials, Brookhaven National Laboratory, which is supported by the U.S. Department of Energy, Office of Basic Energy Sciences, under Contract No. DE-AC02-98CH10886.
